Qubit: two level quantum system

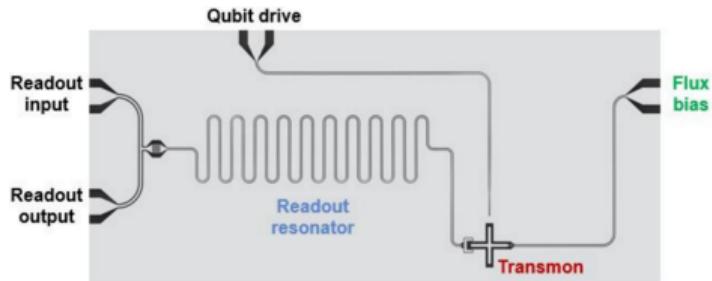

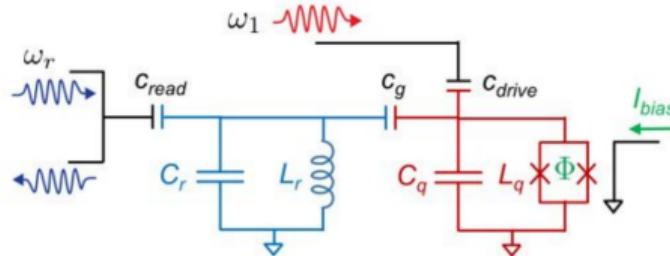

Qubit: two level quantum system

Superconducting qubits: use Josephson Junctions to build anharmonic oscillators

DOI: 10.1109/MAP.2022.3176593

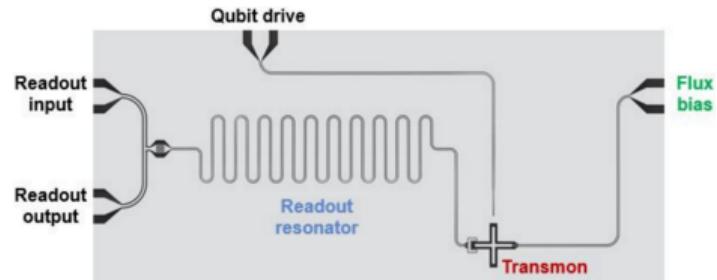

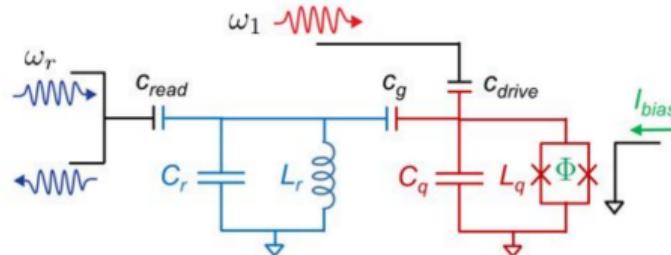

DOI: 10.1109/MAP.2022.3176593

Microwave pulse applied to the qubit

$$V_d(t) = A\varepsilon(t) \sin(\omega_d t + \alpha);$$

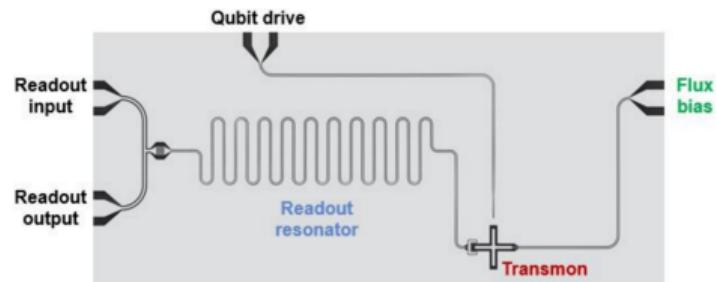

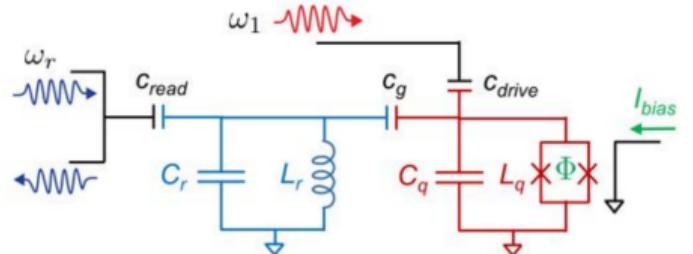

DOI: 10.1109/MAP.2022.3176593

Microwave pulse applied to the qubit

$$V_d(t) = A\varepsilon(t) \sin(\omega_d t + \alpha);$$

Qubit - electric field Hamiltonian (RWA)

$$\hat{H} = -\frac{\hbar(\omega_q - \omega_d)}{2}\hat{\sigma}_z + \frac{\hbar\Omega}{2}\varepsilon(t)(\hat{\sigma}_x \cos \alpha + \hat{\sigma}_y \sin \alpha);$$

DOI: 10.1109/MAP.2022.3176593

Microwave pulse applied to the qubit

$$V_d(t) = A\varepsilon(t) \sin(\omega_d t + \alpha);$$

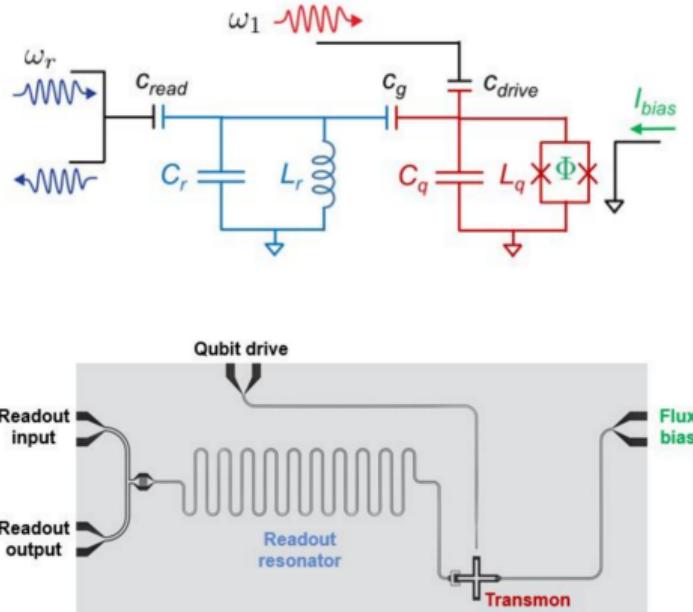

Qubit - electric field Hamiltonian (RWA)

$$\hat{H} = -\frac{\hbar(\omega_q - \omega_d)}{2}\hat{\sigma}_z + \frac{\hbar\Omega}{2}\varepsilon(t)(\hat{\sigma}_x \cos \alpha + \hat{\sigma}_y \sin \alpha);$$

Qubit evolution under microwave pulse:

$$R_{\hat{n}(\alpha)}(\theta) = e^{-\frac{i}{2}\hat{n}(\alpha) \cdot \vec{\sigma}\theta} = e^{-\frac{i}{2}(\hat{\sigma}_x \cos \alpha + \hat{\sigma}_y \sin \alpha)\theta},$$

where  $\theta = \Omega \int_0^{+\infty} \varepsilon(t') dt'$ .

DOI: 10.1109/MAP.2022.3176593

## **Quantum Middleware**

---

# Superconducting qubit calibration

Circuit: sequence of quantum gates applied to qubits to perform a computation.

Circuit with  
logical gates

# Superconducting qubit calibration

Circuit: sequence of quantum gates applied to qubits to perform a computation.

Gates: abstract unitary operations (logical or native).

We need to calibrate *only* native gates.

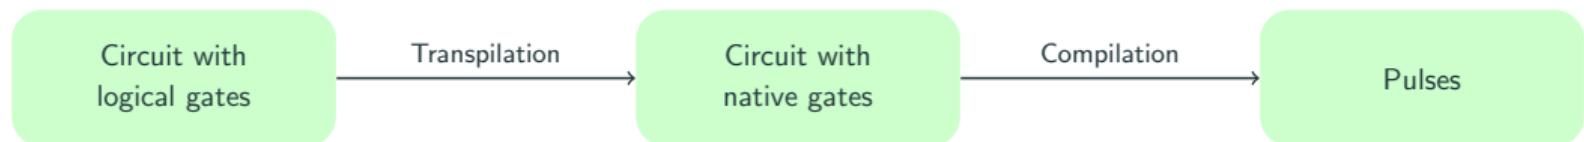

Native single qubit gates on superconducting qubits:  $R_X(\pi)$ ,  $R_X(\frac{\pi}{2})$ ,  $R_Z(\theta)$ .

# Superconducting qubit calibration

Circuit: sequence of quantum gates applied to qubits to perform a computation.

Gates: abstract unitary operations (logical or native).

Pulses: physical signal (control field) implementing a gate.

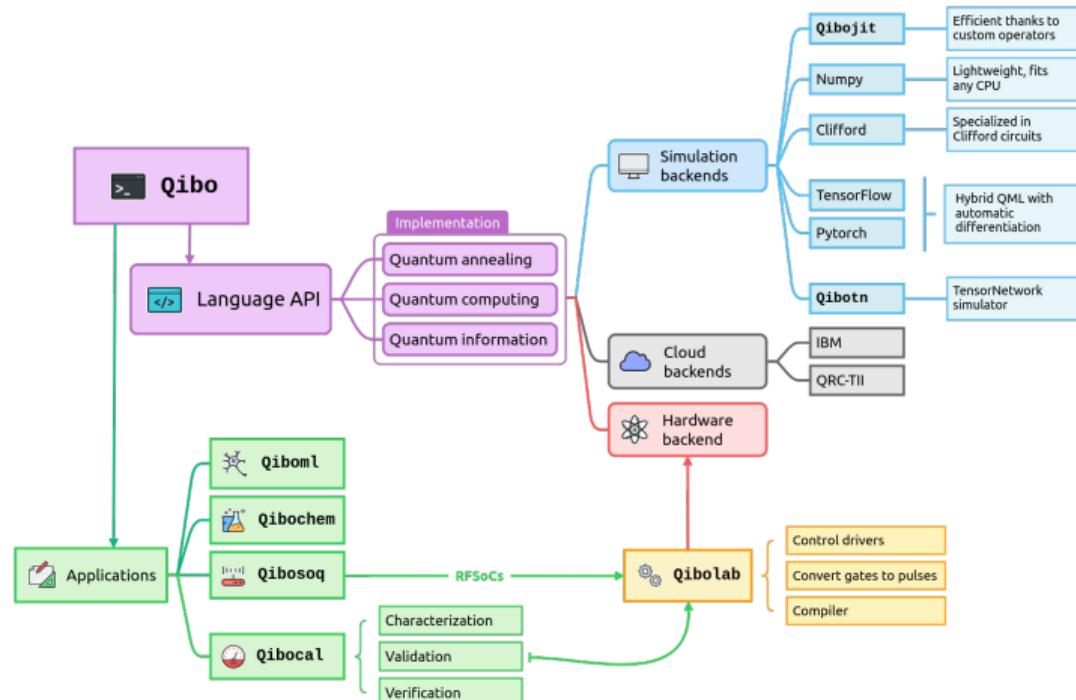

We need to calibrate *only* native gates.

Native single qubit gates on superconducting qubits:  $R_X(\pi)$ ,  $R_X(\frac{\pi}{2})$ ,  $R_Z(\theta)$ .

For each pulse we calibrate frequency, duration, power, shape.

Qibo: a modular and open-source framework for quantum computing, control and calibration.

## **Average Clifford gate fidelity optimization**

---

Randomized benchmarking estimates average gate fidelity by applying random sequences of Clifford gates followed by an inverting gate.

Randomization with Clifford gates provides a depolarized noise channel:

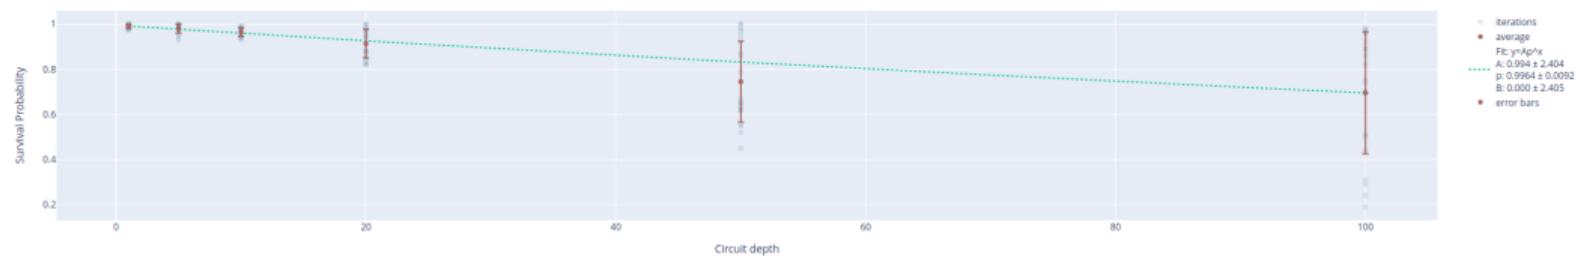

$$\rho \rightarrow d \frac{\mathbb{I}}{2} + (1 - d)\rho.$$

Randomized Benchmarking protocol:

1. Initialize the system in the ground state
2. For each sequence length  $m$  draw a sequence of Clifford group elements
3. Calculate the inverse gate
4. Measure complete sequence
5. Repeat the process for multiple sequences of the same length while varying the length

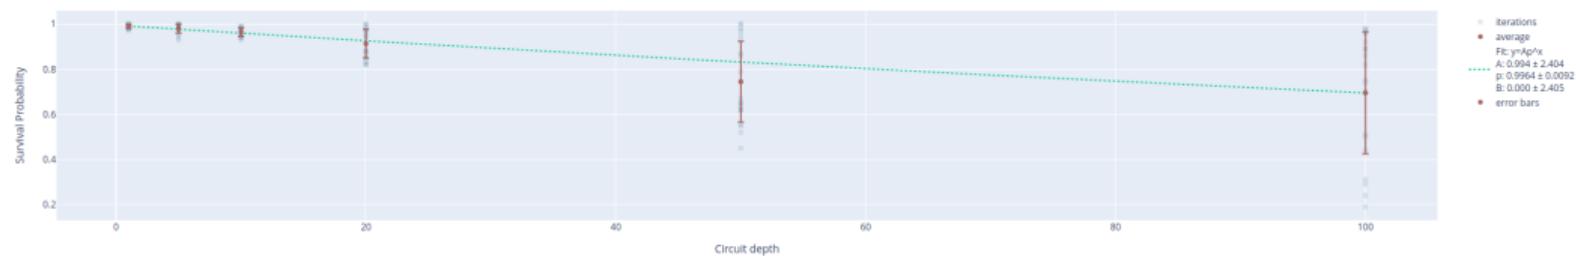

The survival probability decays exponentially with the number of Clifford gates  
 $F(m) = Ap^m + B$  where  $1 - p$  is the depolarization rate.

From  $p$  we can extract the average error per Clifford gate.

The survival probability decays exponentially with the number of Clifford gates  
 $F(m) = Ap^m + B$  where  $1 - p$  is the depolarization rate.

From  $p$  we can extract the average error per Clifford gate.

Can we optimize the average Clifford gate fidelity to automate  $R_X(\pi)$  gate recalibration?

Test closed-loop optimization with modern optimization libraries.

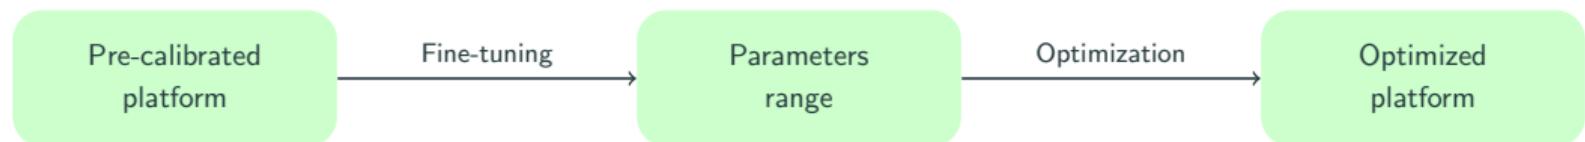

Test closed-loop optimization with modern optimization libraries.

Pre-calibrated  
platform

Test closed-loop optimization with modern optimization libraries.

Test closed-loop optimization with modern optimization libraries.

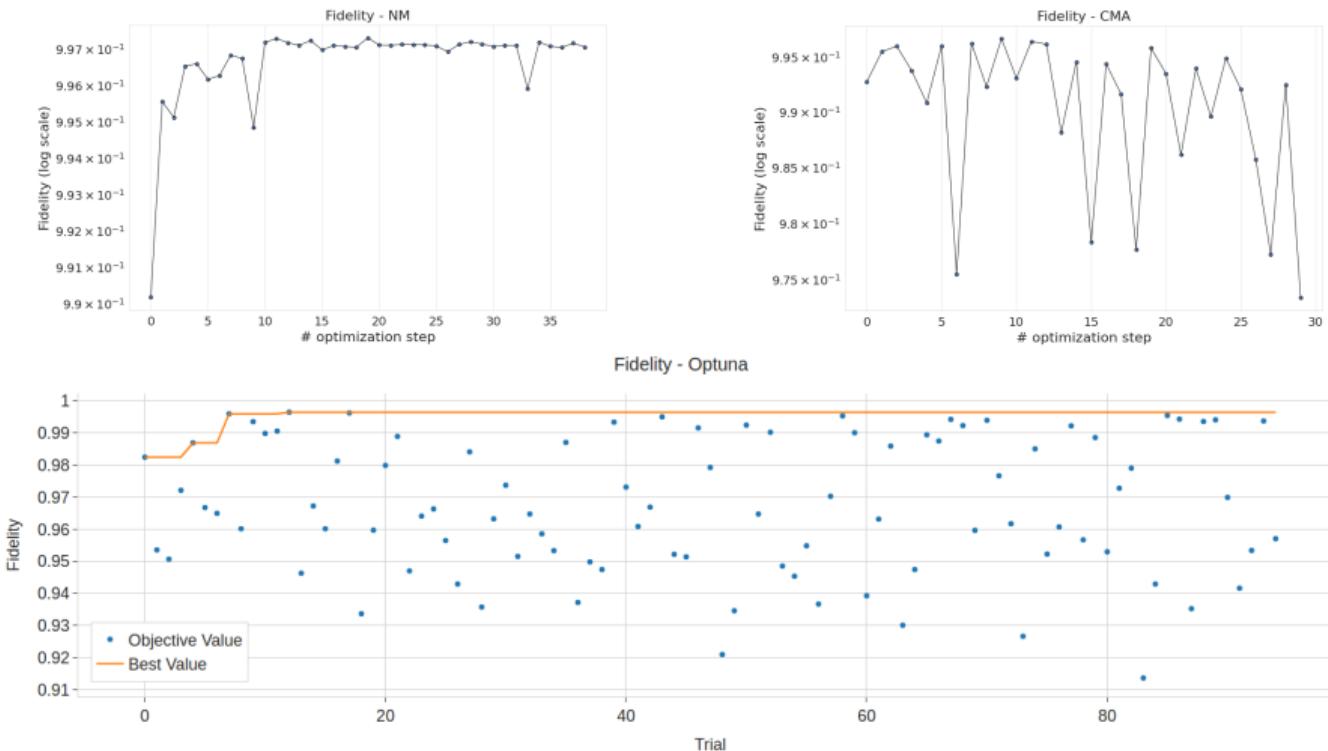

Optimization parameters:

Pulse amplitude

Pulse frequency

Pulse shape (through  $\beta$  DRAG parameter)

# Average Clifford gate Fidelity

## New features in Qibo

---

# Improving Qubit Control for Calibration

## Single qubit gates:

Qibo already implement many calibration routines for  $R_X(\pi)$ .

We can try to reduce residual errors by adding calibrating  $R_X(\pi/2)$  as native gate.

# Improving Qubit Control for Calibration

## Single qubit gates:

Qibo already implement many calibration routines for  $R_X(\pi)$ .

We can try to reduce residual errors by adding calibrating  $R_X(\pi/2)$  as native gate.

Introduce support for  $R_X(\pi/2)$  as native gate in Qibolab.

## Native RX90

Qibolab single-qubit native gates are  $R_X(\pi)$  and  $MZ$ .

## Native RX90

Qibolab single-qubit native gates are  $R_X(\pi)$  and  $MZ$ .

$R_X(\frac{\pi}{2})$  gate is implemented by halving the calibrated values for  $R_X(\pi)$ .

## Native RX90

Qibolab single-qubit native gates are  $R_X(\pi)$  and  $MZ$ .

$R_X(\frac{\pi}{2})$  gate is implemented by halving the calibrated values for  $R_X(\pi)$ .

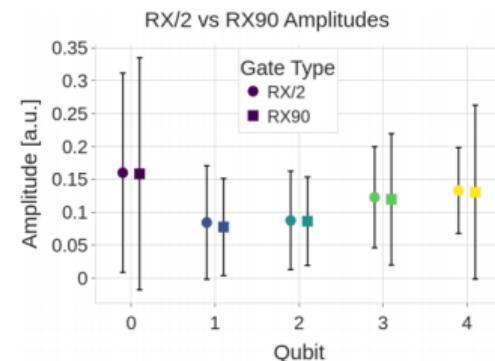

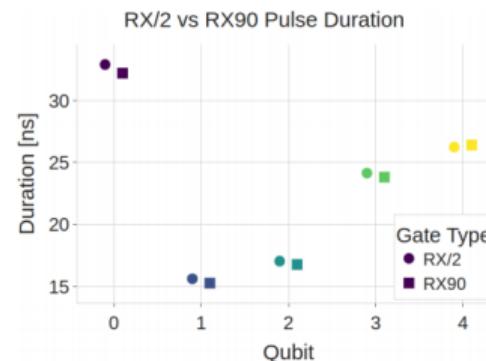

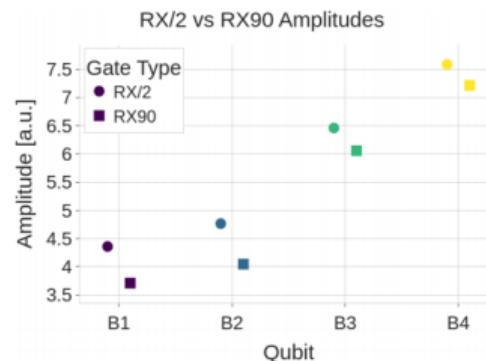

Problem: there may be nonlinearities and distortions in signals that degradete the  $R_X(\frac{\pi}{2})$  fidelity.

Frequency tuning is achieved via flux pulses applied to tunable qubits.

Add Cryoscope portocol to improve control over flux pulses.

DOI: 10.1039/D2TC01258H

Transmon frequency dependence on magnetic flux:

$$f_q(\Phi_q) \approx \left( \sqrt{8E_J E_C} \left| \cos\left(\pi \frac{\Phi_q}{\Phi_0}\right) \right| \right).$$

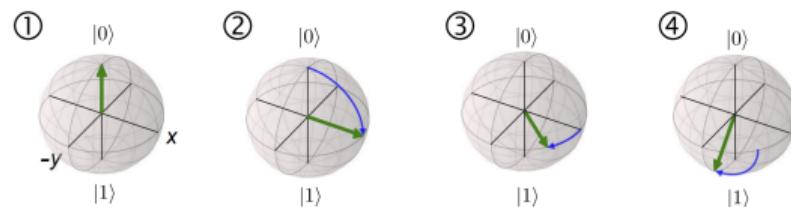

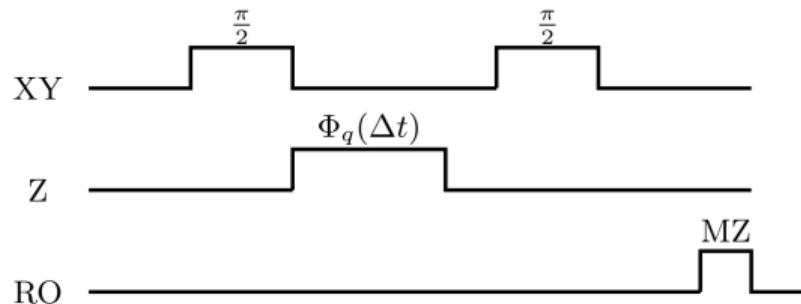

DOI: 10.1039/D2TC01258H

Transmon frequency dependence on magnetic flux:

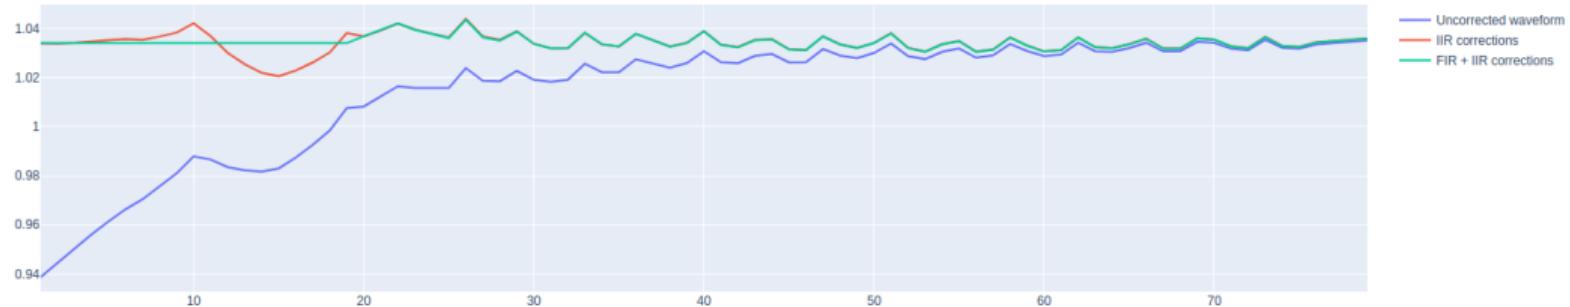

$$f_q(\Phi_q) \approx \left( \sqrt{8E_J E_C} \left| \cos\left(\pi \frac{\Phi_q}{\Phi_0}\right) \right| \right).$$

Detuning as function of the flux pulse:

$$\Delta f_q = \frac{\varphi_{\tau+\Delta\tau} - \varphi_\tau}{2\pi} \approx \frac{1}{\Delta\tau} \int_{\tau}^{\tau+\Delta\tau} \Delta f_q(\Phi_{q,\tau+\Delta\tau}(t)).$$

GUIDES

Tutorials

Protocols

Time Of Flight (Readout)

Calibrate Discrimination Kernels

Resonator spectroscopy

Resonator punchout

Qubit spectroscopies

Rabi experiments

Ramsey experiments

`relaxation_time: float`

Wait time for the qubit to decohere back to the *gnd* state.

## Example

A possible runcard to launch a Cryoscope experiment could be the following:

```
- id: cryoscope

operation: cryoscope
parameters:
    duration_max: 80
    duration_min: 1
    duration_step: 1
    flux_pulse_amplitude: 0.7
    relaxation_time: 50000
```

The expected output is the following:

### Note

In the case where there are no filters the protocol will compute the FIR and the IIR filters. If the filters are already present the computation of the filters will be skipped and only the reconstructed waveform will be shown.

## Gate recalibration by RB optimization

- ✓ We can always find parameters configuration with average Clifford gate fidelity > 99.5%.
- ✓ Does **not rely on manual tuning** by an operator.
- ✗ RB evaluation is **computationally expensive** ( $\sim 30$  minutes).
- ✗ More stable methods (eg. Nelder-Mead) require many cost function evaluation.
- ✗ Parameters drift makes optimization unstable.

Possible future work: **optimize RB parameters** to allow a faster and more reliable optimization.

## Library additions

- ✓ Extended Qibolab and Qibocal libraries to support **native  $R_X(\pi/2)$  gates** with dedicated calibration routines.
- ✓ Implemented and added the **Cryoscope** calibration experiment to Qibocal library to correct flux-pulse distortions (average NMSE improvement  $\sim 70\%$ ).
- ✗ Study long-time distortions of the flux-pulse.

Possible future extensions:

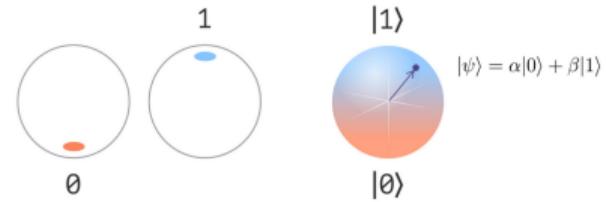

- Readout optimization protocols
- Active qubit reset schemes
- Implement leakage mitigation strategies

**Thank you**

# Parameters evolution

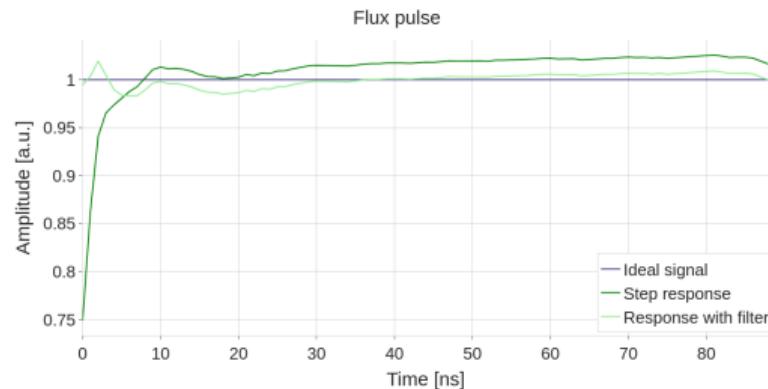

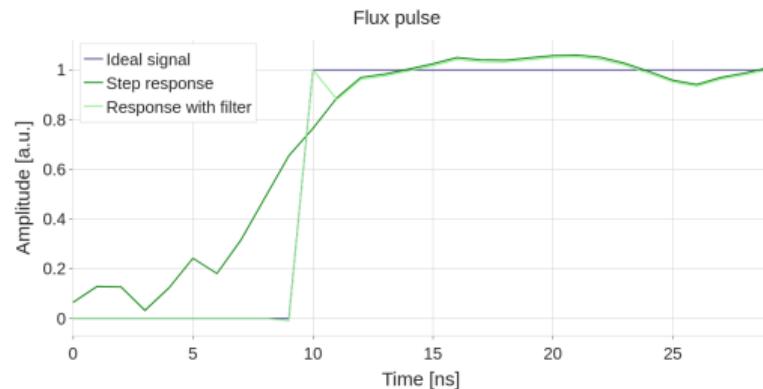

## Filter determination details

Compensate distortion using a digital IIR filter based on an inverted exponential model

$$s_{\text{corr}}(t) = \frac{s(t)}{g(1 - Ae^{-t/\tau})}$$

parameters  $g$ ,  $A$ , and  $\tau$  are estimated via least-squares minimization using `scipy.optimize`

## Filter determination details

Digital IIR filter implemented in control hardware using discretized coefficients.

$$a_0 y[n] = \sum_{i=0}^N b_i x[n-i] - \sum_{i=1}^M a_i y[n-i],$$

Filter coefficients derived from fitted parameters (1st order IIR):

$$a_0 = 1,$$

where  $\alpha = 1 - \exp\left(-\frac{1}{f_s \cdot \tau(1+A)}\right)$  and

$$a_1 = -(1 - \alpha),$$

$$b_0 = 1 - k + k\alpha,$$

$$b_1 = -(1 - k)(1 - \alpha),$$

$$k = \begin{cases} \frac{A}{(1+A)(1-\alpha)}, & \text{if } A < 0, \\ \frac{A}{1+A-\alpha}, & \text{if } A \geq 0, \end{cases}$$

FIR filters:

$$y[n] = \sum_{i=0}^N b_i x[n-i],$$

FIR filter coefficients are optimized using CMA-ES to minimize the average relative deviation between the FIR-filtered IIR-corrected signal and the ideal step response.
